

# PowerShell and Regular Expressions

**TRAINSIGNAL**  
THE GLOBAL STANDARD IN PROFESSIONAL COMPUTER TRAINING

---

---

---

---

---

---

---

## Introduction to Regular Expressions

A regular expression is a way of describing data by what it looks like:

- \\chi-fp01\public
- 172.16.30.203
- Globomantics\jeff

PowerShell supports the full .NET Regular Expression library

Regular expressions can be case sensitive

Full coverage of regular expressions is outside the scope of this course

---

---

---

---

---

## Regular Expression Operators

Wildcard comparisons

- Like
- NotLike

Regular Expression comparison

- Match
- NotMatch

True or False results

**TRAINSIGNAL**

---

---

---

---

---

---

---

### Wildcard Matching

Compare strings

Comparison string uses wildcard characters

Useful for simple matching

```
PS C:\> "Powershell" -like "*shell"  
True  
PS C:\> "Powershell" -notlike "cmd*"  
True
```

TRAINSIGNAL

---

---

---

---

---

---

---

### Matching

Can match on simple strings

Can match on a regular expression pattern

Matches "float" unless anchored

Matching creates a MatchInfo object

Match stops at first non-matching character

```
PS C:\> "Powershell" -match "shell"  
True  
PS C:\> "Powershell" -notmatch "cmd"  
True
```

---

---

---

---

---

---

### Regular Expression Basics

Matches on character sets

Match on any single character .

Match on a single set of characters [abc]

Match on a range of characters [m-z]

Anchor starting at the beginning ^

Anchor from the end \$

The regular expression escape character \

---

---

---

---

---

---

## Commonly Used Character Sets

Character Set	Description
\w	Match any word character including numbers
\W	Match any non-word character
\d	Match any digit
\D	Match any non-digit
\s	Match any white space character
\S	Match any non white space character

---

---

---

---

---

---

---

## Quantifiers

Quantifier	Description
+	Match repeating instances of preceding character
*	Match zero or more instances of preceding character
?	Match 0 or 1 instances of preceding character
{n}	Match exactly n number of preceding characters
{n,}	Match at least n number of preceding characters
{n,m}	Match at least n number of preceding characters and no more than m

---

---

---

---

---

---

## Common Regular Expression Patterns

<b>Phone</b> " <code>\d{3}-\d{4}</code> "	<b>IP Address</b> " <code>[d{1,3}\.d{1,3}\.d{1,3}\.d{1,3}]</code> "
<b>Logon</b> " <code>[w+][ w+]</code> "	<b>UNC</b> " <code>[ ][ ][ w+][ w+]</code> "

- May need to anchor to stop the float

---

---

---

---

---

---

## Regular Expressions in Action

---

---

---

---

---

---

---

### Introducing the Regex Object

Create with the [regex] type accelerator

Find multiple matches

Is case sensitive

```
PS C:\> [regex]$rx = "^\\\\\\CHI-\\w+\\d{2}\\\\\\w+$"  
PS C:\> $rx.match($name)
```

```
Groups   : {\\\\CHI-FP01\\public}  
Success  : True  
Captures : {\\\\CHI-FP01\\public}  
Index    : 0  
Length   : 17  
Value     : \\\CHI-FP01\\public
```

TRAINSIGNAL

---

---

---

---

---

---

---

## Regex in Action

---

---

---

---

---

---

---

## Select-String

Find text in strings and files  
Use simple or complex patterns  
Can be case-sensitive  
Can find multiple matches  
Can display context  
Writes a MatchInfo object to the pipeline

```
PS C:\> dir c:\work\*.txt | select-string  
"globomantics" | select filename
```

TRAINSIGNAL

---

---

---

---

---

---

---

---

## Select-String in Action

---

---

---

---

---

---

---

---

## Lab

1. Create a regular expression pattern for a phone number and test it with a variety of numbers, good and bad.
2. Create a text file of phone numbers and use Select-String to find all numbers that match.
3. Repeat #2 but find all numbers that do not match.
